

RSS-Feed

If the RSS option is activated, the Contrex blog module will automatically generate RSS-feed based on your blog entries and the associated comments. Thereby one directory will be created per activated system language in the location **feed/**, containing the following XML files:

`blog_messages_XX.xml`

`blog_comments_XX.xml`

`blog_category_ID_XX.xml`

"XX" is the placeholder for the short form of the language and "ID" is the placeholder of the ID of associated blog category. For example for the language german (short form: de) the complete link would be as follows:

`http://www.yoursite.com/feed/blog_messages_de.xml`

`http://www.yoursite.com/feed/blog_comments_de.xml`

For the category 1 (ID = 1) in the german language the link would be as follows:

`http://www.yoursite.com/feed/blog_category_1_de.xml`

For a complete reference of all short forms refer to the language settings in the backend under **"Administration" -> "Language settings"**.
